

Week2 Lecture Notes: Introducing to different parts of C++ Programming Objectives

Concepts covered in this lesson:

- The Parts of a C++ Program
- The cout Object
- Variables and Literals
- Identifiers
- Integer Data Types
- Variable Assignments and Initialization
- Scope
- Arithmetic Operators
- Comments

The Parts of a C++ Program

```
// sample C++ program ← comment
#include <iostream> ← preprocessor directive
using namespace std; ← which namespace to use
int main() ← beginning of function named main
{ ← beginning of block for main
    cout << "Hello, there!"; ← output statement
    return 0; ← Send 0 to operating system
} ← end of block for main
```

Diagram illustrating the parts of a C++ program with annotations:

- `// sample C++ program`: comment
- `#include <iostream>`: preprocessor directive
- `using namespace std;`: which namespace to use
- `int main()`: beginning of function named `main`
- `{`: beginning of block for `main`
- `cout << "Hello, there!";`: output statement
- `return 0;`: Send 0 to operating system
- `}`: end of block for `main`

Special Characters

Character	Name	Meaning
//	Double slash	Beginning of a comment
#	Pound sign	Beginning of preprocessor directive
< >	Open/close brackets	Enclose filename in #include
()	Open/close parentheses	Used when naming a function
{ }	Open/close brace	Encloses a group of statements
" "	Open/close quotation marks	Encloses string of characters
;	Semicolon	End of a programming statement

2.2

The `cout` Object

The cout Object

- Displays output on the computer screen
- You use the stream insertion operator << to send output to cout:

```
cout << "Programming is fun!";
```

The cout Object

- Can be used to send more than one item to cout:

```
cout << "Hello " << "there!";
```

Or:

```
cout << "Hello ";
```

```
cout << "there!";
```

The cout Object

- This produces one line of output:

```
cout << "Programming is ";  
cout << "fun!";
```

The endl Manipulator

- You can use the `endl` manipulator to start a new line of output. This will produce two lines of output:

```
cout << "Programming is" << endl;  
cout << "fun!";
```

The endl Manipulator

```
cout << "Programming is" << endl;  
cout << "fun!";
```

The endl Manipulator

- You do NOT put quotation marks around `endl`
- The last character in `endl` is a lowercase L, not the number 1.

`endl` ← This is a lowercase L

The `\n` Escape Sequence

- You can also use the `\n` escape sequence to start a new line of output. This will produce two lines of output:

```
cout << "Programming is\n";  
cout << "fun!";
```

Notice that the `\n` is INSIDE
the string.

The `\n` Escape Sequence

```
cout << "Programming is\n";  
cout << "fun!";
```

2.3

The `#include` Directive

The `#include` Directive

- Inserts the contents of another file into the program
- This is a preprocessor directive, not part of C++ language
- `#include` lines not seen by compiler
- Do not place a semicolon at end of `#include` line

2.4

Variables and Literals

Variables and Literals

- Variable: a storage location in memory
 - Has a name and a type of data it can hold
 - Must be defined before it can be used:

```
int item;
```

Variable Definition in Program 2-7

Program 2-7

```
1  // This program has a variable.
2  #include <iostream>
3  using namespace std;
4
5  int main()
6  {
7      int number;
8
9      number = 5;
10     cout << "The value in number is " << number << endl;
11     return 0;
12 }
```

← Variable Definition

Program Output

The value in number is 5

Literals

- Literal: a value that is written into a program's code.

`"hello, there"` (string literal)

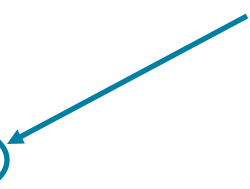

`12` (integer literal)

Integer Literal in Program 2-9

Program 2-9

```
1  // This program has literals and a variable.
2  #include <iostream>
3  using namespace std;
4
5  int main()
6  {
7      int apples;
8
9      apples = 20;
10     cout << "Today we sold " << apples << " bushels of apples.\n";
11     return 0;
12 }
```

20 is an integer literal

Program Output

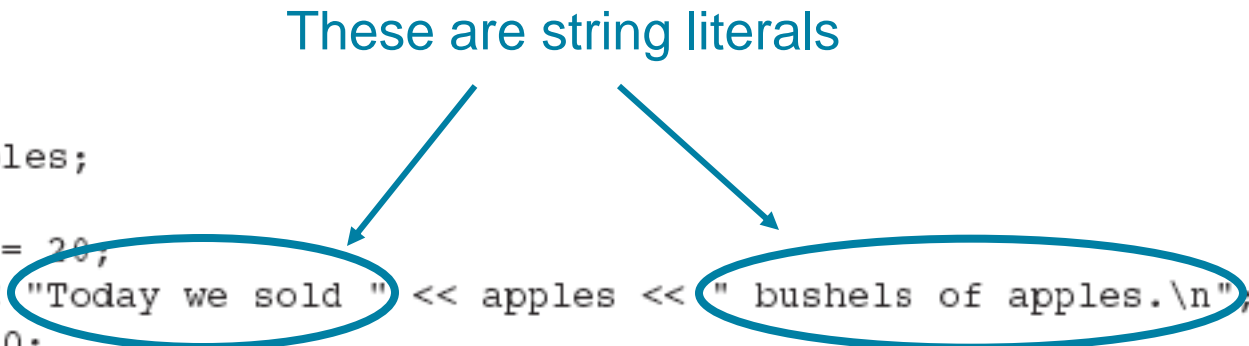

Today we sold 20 bushels of apples.

String Literals in Program 2-9

Program 2-9

```
1 // This program has literals and a variable.
2 #include <iostream>
3 using namespace std;
4
5 int main()
6 {
7     int apples;
8
9     apples = 20;
10    cout << "Today we sold " << apples << " bushels of apples.\n";
11    return 0;
12 }
```

These are string literals

Program Output

Today we sold 20 bushels of apples.

2.5

Identifiers

Identifiers

- An identifier is a programmer-defined name for some part of a program: variables, functions, etc.

C++ Key Words

Table 2-4 The C++ Key Words

alignas	const	for	private	throw
alignof	constexpr	friend	protected	true
and	const_cast	goto	public	try
and_eq	continue	if	register	typedef
asm	decltype	inline	reinterpret_cast	typeid
auto	default	int	return	typename
bitand	delete	long	short	union
bitor	do	mutable	signed	unsigned
bool	double	namespace	sizeof	using
break	dynamic_cast	new	static	virtual
case	else	noexcept	static_assert	void
catch	enum	not	static_cast	volatile
char	explicit	not_eq	struct	wchar_t
char16_t	export	nullptr	switch	while
char32_t	extern	operator	template	xor
class	false	or	this	xor_eq
compl	float	or_eq	thread_local	

You cannot use any of the C++ key words as an identifier. These words have reserved meaning.

Variable Names

- A variable name should represent the purpose of the variable. For example:

`itemsOrdered`

The purpose of this variable is to hold the number of items ordered.

Identifier Rules

- The first character of an identifier must be an alphabetic character or an underscore (_),
- After the first character you may use alphabetic characters, numbers, or underscore characters.
- Upper- and lowercase characters are distinct

Valid and Invalid Identifiers

IDENTIFIER	VALID?	REASON IF INVALID
totalSales	Yes	
total_Sales	Yes	
total.Sales	No	Cannot contain .
4thQtrSales	No	Cannot begin with digit
totalSale\$	No	Cannot contain \$

2.6

Integer Data Types

Integer Data Types

Table 2-6 Integer Data Types

Data Type	Typical Size	Typical Range
short int	2 bytes	−232,768 to 132,767
unsigned short int	2 bytes	0 to +65,535
int	4 bytes	−22,147,483,648 to 12,147,483,647
unsigned int	4 bytes	0 to 4,294,967,295
long int	4 bytes	−22,147,483,648 to 12,147,483,647
unsigned long int	4 bytes	0 to 4,294,967,295
long long int	8 bytes	−29,223,372,036,854,775,808 to 9,223,372,036,854,775,807
unsigned long long int	8 bytes	0 to 18,446,744,073,709,551,615

Defining Variables

- Variables of the same type can be defined
 - On separate lines:
`int length;`
`int width;`
`unsigned int area;`
 - On the same line:
`int length, width;`
`unsigned int area;`
- Variables of different types must be in different definitions

Integer Types in Program 2-10

```
1 // This program has variables of several of the integer types.
2 #include <iostream>
3 using namespace std;
4
5 int main()
6 {
7     int checking;
8     unsigned int miles;
9     long diameter;
10
11     checking = -20;
12     miles = 4276;
13     diameter = 100000;
14     cout << "We have made a long journey of " << miles;
15     cout << " miles.\n";
16     cout << "Our checking account balance is " << checking;
17     cout << "\nThe galaxy is about " << diameter;
18     cout << " light years in diameter.\n";
19     return 0;
20 }
```

This program has three
variables:

checking, miles, and diameter

Integer Literals

- An integer literal is an integer value that is typed into a program's code. For example:

```
itemsOrdered = 15;
```

In this code, 15 is an integer literal.

Integer Literals in Program 2-10

```
1 // This program has variables of several of the integer types.
2 #include <iostream>
3 using namespace std;
4
5 int main()
6 {
7     int checking;
8     unsigned int miles;
9     long diameter;
10
11     checking = -20;
12     miles = 4276;
13     diameter = 100000;
14     cout << "We have made a long journey of " << miles;
15     cout << " miles.\n";
16     cout << "Our checking account balance is " << checking;
17     cout << "\nThe galaxy is about " << diameter;
18     cout << " light years in diameter.\n";
19     return 0;
20 }
```

Integer Literals

Integer Literals

- Integer literals are stored in memory as `ints` by default
- To store an integer constant in a long memory location, put '`L`' at the end of the number: `1234L`
- To store an integer constant in a long long memory location, put '`LL`' at the end of the number: `324LL`
- Constants that begin with '`0`' (zero) are base 8:
`075`

2.7

The `char` Data Type

The char Data Type

- Used to hold characters or very small integer values
- Usually 1 byte of memory
- Numeric value of character from the character set is stored in memory:

CODE:

```
char letter;  
letter = 'C';
```

MEMORY:

letter

67

Character Literals

- Character literals must be enclosed in single quote marks. Example:

'A'

Character Literals in Program 2-14

Program 2-14

```
1  // This program uses character literals.
2  #include <iostream>
3  using namespace std;
4
5  int main()
6  {
7      char letter;
8
9      letter = 'A';
10     cout << letter << '\n';
11     letter = 'B';
12     cout << letter << '\n';
13     return 0;
14 }
```

Program Output

A
B

Character Strings

- A series of characters in consecutive memory locations:
 `"Hello"`
- Stored with the null terminator, `\0`, at the end:
- Comprised of the characters between the " "

H	e	l	l	o	\0
---	---	---	---	---	----

2.8

The C++ `string` Class

The C++ string Class

- Special data type supports working with strings
`#include <string>`
- Can define string variables in programs:
`string firstName, lastName;`
- Can receive values with assignment operator:
`firstName = "George";`
`lastName = "Washington";`
- Can be displayed via `cout`
`cout << firstName << " " << lastName;`

The string class in Program 2-15

Program 2-15

```
1  // This program demonstrates the string class.
2  #include <iostream>
3  #include <string> // Required for the string class.
4  using namespace std;
5
6  int main()
7  {
8      string movieTitle;
9
10     movieTitle = "Wheels of Fury";
11     cout << "My favorite movie is " << movieTitle << endl;
12     return 0;
13 }
```

Program Output

My favorite movie is Wheels of Fury

2.9

Floating-Point Data Types

Floating-Point Data Types

- The floating-point data types are:
`float`
`double`
`long double`
- They can hold real numbers such as:
12.45 -3.8
- Stored in a form similar to scientific notation
- All floating-point numbers are signed

Floating-Point Data Types

Table 2-8 Floating-Point Data Types on PCs

Data Type	Key Word	Description
Single precision	float	4 bytes. Numbers between $\pm 3.4\text{E}-38$ and $\pm 3.4\text{E}38$
Double precision	double	8 bytes. Numbers between $\pm 1.7\text{E}-308$ and $\pm 1.7\text{E}308$
Long double precision	long double	8 bytes*. Numbers between $\pm 1.7\text{E}-308$ and $\pm 1.7\text{E}308$

*Some compilers use 10 bytes for long doubles. This allows a range of $\pm 3.4\text{E}-4932$ to $\pm 1.1\text{E}4832$.

Floating-Point Literals

- Can be represented in
 - Fixed point (decimal) notation:
`31.4159` `0.0000625`
 - E notation:
`3.14159E1` `6.25e-5`
- Are `double` by default
- Can be forced to be float (`3.14159f`) or long double (`0.0000625L`)

Floating-Point Data Types in Program 2-16

Program 2-16

```
1  // This program uses floating point data types.
2  #include <iostream>
3  using namespace std;
4
5  int main()
6  {
7      float distance;
8      double mass;
9
10     distance = 1.495979E11;
11     mass = 1.989E30;
12     cout << "The Sun is " << distance << " meters away.\n";
13     cout << "The Sun\'s mass is " << mass << " kilograms.\n";
14     return 0;
15 }
```

Program Output

The Sun is 1.49598e+011 meters away.
The Sun's mass is 1.989e+030 kilograms.

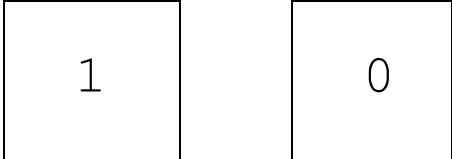

2.10

The `bool` Data Type

The bool Data Type

- Represents values that are `true` or `false`
- `bool` variables are stored as small integers
- `false` is represented by 0, `true` by 1:

```
bool allDone = true;    allDone finished
bool finished = false;  1      0
```

Boolean Variables in Program 2-17

Program 2-17

```
1  // This program demonstrates boolean variables.
2  #include <iostream>
3  using namespace std;
4
5  int main()
6  {
7      bool boolValue;
8
9      boolValue = true;
10     cout << boolValue << endl;
11     boolValue = false;
12     cout << boolValue << endl;
13     return 0;
14 }
```

Program Output

1

0

2.11

Determining the Size of a Data Type

Determining the Size of a Data Type

- The `sizeof` operator gives the size of any data type or variable:

```
double amount;
```

```
cout << "A double is stored in "
```

```
    << sizeof(double) << "bytes\n";
```

```
cout << "Variable amount is stored in  
"
```

```
    << sizeof(amount)
```

```
    << "bytes\n";
```

2.12

Variable Assignments and Initialization

Variable Assignments and Initialization

- An assignment statement uses the = operator to store a value in a variable.

```
item = 12;
```

- This statement assigns the value 12 to the `item` variable.

Assignment

- The variable receiving the value must appear on the left side of the = operator.
- This will NOT work:

```
// ERROR!  
12 = item;
```

Variable Initialization

- To initialize a variable means to assign it a value when it is defined:

```
int length = 12;
```

- Can initialize some or all variables:

```
int length = 12, width = 5, area;
```

Variable Initialization in Program 2-19

Program 2-19

```
1  // This program shows variable initialization.
2  #include <iostream>
3  using namespace std;
4
5  int main()
6  {
7      int month = 2, days = 28;
8
9      cout << "Month " << month << " has " << days << " days.\n";
10     return 0;
11 }
```

Program Output

Month 2 has 28 days.

Declaring Variables With the `auto` Key Word

- C++ 11 introduces an alternative way to define variables, using the `auto` key word and an initialization value. Here is an example:

```
auto amount = 100; ← int
```

- The `auto` key word tells the compiler to determine the variable's data type from the initialization value.

```
auto interestRate = 12.0;
auto stockCode = 'D'; ← double
auto customerNum = 459L; ← char
                        ← long
```

2.13

Scope

Scope

- The scope of a variable: the part of the program in which the variable can be accessed
- A variable cannot be used before it is defined

Variable Out of Scope in Program 2-20

Program 2-20

```
1  // This program can't find its variable.
2  #include <iostream>
3  using namespace std;
4
5  int main()
6  {
7      cout << value; // ERROR! value not defined yet!
8
9      int value = 100;
10     return 0;
11 }
```

2.14

Arithmetic Operators

Arithmetic Operators

- Used for performing numeric calculations
- C++ has unary, binary, and ternary operators:
 - unary (1 operand) `-5`
 - binary (2 operands) `13 - 7`
 - ternary (3 operands) `exp1 ? exp2 : exp3`

Binary Arithmetic Operators

SYMBOL	OPERATION	EXAMPLE	VALUE OF ans
+	addition	ans = 7 + 3;	10
-	subtraction	ans = 7 - 3;	4
*	multiplication	ans = 7 * 3;	21
/	division	ans = 7 / 3;	2
%	modulus	ans = 7 % 3;	1

Arithmetic Operators in Program 2-21

Program 2-21

```
1 // This program calculates hourly wages, including overtime.
2 #include <iostream>
3 using namespace std;
4
5 int main()
6 {
7     double regularWages,           // To hold regular wages
8           basePayRate = 18.25,     // Base pay rate
9           regularHours = 40.0,     // Hours worked less overtime
10          overtimeWages,           // To hold overtime wages
11          overtimePayRate = 27.78, // Overtime pay rate
12          overtimeHours = 10,      // Overtime hours worked
13          totalWages;              // To hold total wages
14
15     // Calculate the regular wages.
16     regularWages = basePayRate * regularHours;
17
18     // Calculate the overtime wages.
19     overtimeWages = overtimePayRate * overtimeHours;
20
21     // Calculate the total wages.
22     totalWages = regularWages + overtimeWages;
23
24     // Display the total wages.
25     cout << "Wages for this week are $" << totalWages << endl;
26     return 0;
27 }
```

Program Output

Wages for this week are \$1007.8

A Closer Look at the / Operator

- / (division) operator performs integer division if both operands are integers

```
cout << 13 / 5;      // displays 2
```

```
cout << 91 / 7;      // displays 13
```

- If either operand is floating point, the result is floating point

```
cout << 13 / 5.0;    // displays 2.6
```

```
cout << 91.0 / 7;    // displays 13.0
```

A Closer Look at the % Operator

- % (modulus) operator computes the remainder resulting from integer division

```
cout << 13 % 5;    // displays 3
```

- % requires integers for both operands

```
cout << 13 % 5.0; // error
```

2.15

Comments

Comments

- Used to document parts of the program
- Intended for persons reading the source code of the program:
 - Indicate the purpose of the program
 - Describe the use of variables
 - Explain complex sections of code
- Are ignored by the compiler

Single-Line Comments

- Begin with `//` through to the end of line:

```
int length = 12; // length in inches
int width = 15;  // width in inches
int area;        // calculated area

// calculate rectangle area
area = length * width;
```

Multi-Line Comments

- Begin with `/*`, end with `*/`

- Can span multiple lines:

```
/* this is a multi-line  
   comment  
*/
```

- Can begin and end on the same line:

```
int area;    /* calculated area */
```

2.16

Named Constants

Named Constants

- Named constant (constant variable): variable whose content cannot be changed during program execution
- Used for representing constant values with descriptive names:

```
const double TAX_RATE = 0.0675;  
const int NUM_STATES = 50;
```

- Often named in uppercase letters

Named Constants in Program 2-28

Program 2-28

```
1 // This program calculates the circumference of a circle.
2 #include <iostream>
3 using namespace std;
4
5 int main()
6 {
7     // Constants
8     const double PI = 3.14159;
9     const double DIAMETER = 10.0;
10
11     // Variable to hold the circumference
12     double circumference;
13
14     // Calculate the circumference.
15     circumference = PI * DIAMETER;
16
17     // Display the circumference.
18     cout << "The circumference is: " << circumference << endl;
19     return 0;
20 }
```

Program Output

The circumference is: 31.4159

2.17

Programming Style

Programming Style

- The visual organization of the source code
- Includes the use of spaces, tabs, and blank lines
- Does not affect the syntax of the program
- Affects the readability of the source code
